

Early Bite

25-10-0

The first choice for early spring grazing

A leach resistant product ideally suited to early spring applications

Delivers a synergistic effect from Nitrogen and Phosphate being in the same granule which gives:

- Better Nitrogen utilization
- More yield
- Greater environmental protection

A Potash-free product and therefore less risk of grass staggers

Phosphate is delivered as ammonium phosphate, the form which is used most efficiently by spring grass, leading to:

- Higher yields
- Higher herbage Phosphorous content

Contains over 90% water soluble phosphate which means:

- Phosphate which is immediately available to the plant
- Higher yields from Phosphate-responsive crops
- A healthy root system for optimum nutrient uptake
- Higher level of herbage Phosphorus and so healthy livestock

Features	Benefits
A True Granular Compound	Even application of nutrients to 24m and above where required (with a correctly calibrated spreader)
High N and medium P levels	Supply productive early N dressin on grazing ground together with total season P dressing, getting early applied P response when root growth at it's most active
Zero Potash	Allows early application of N and P without increased risk of 'grass staggers' from early Potash application
Manufactured at sites which are accredited to ISO 9001:2000	Reliable product, consistent quality, confidence in use and response

GrowHow recommends that you set up your spreader for both application rate and spread pattern.
